

# Masaar

SMART TOOLS FOR LEBANESE BUSINESSES

Social-commerce operations, cash accountability and decision intelligence

COMPETITION-READY IMPLEMENTED BUILD

## PROJECT OVERVIEW

# From a message to a decision

Masaar is the operational system behind Lebanese businesses that sell through Instagram, WhatsApp, TikTok, Facebook, websites, phone or a store. It captures the order once, controls products, addresses, delivery, payment and cash custody, then converts the same trusted events into explainable business decisions.

### The problem

Orders, addresses, delivery outcomes and money are scattered across chats, screenshots, spreadsheets and memory. The result is forgotten orders, wrong addresses, duplicate work, unreturned cash, stock surprises and no reliable view of profit.

### The solution

One role-based, mobile-ready control center for the entire post-order path—plus a Decision Engine that separates revenue, profit, collected money, outstanding balances and stock cash before recommending the next action.

## Core operating loop

### What makes Masaar different

Lebanon-first USD/LBP price and cost truth; Cash, Whish and OMT records; driver-held-cash reconciliation; eight-governorate delivery setup; standardized local addresses; low-connectivity driver queue; supplier/stock exposure; and a transparent Morning Brief instead of decorative analytics.

# The platform judges can operate

## Orders & customers

Quick Order, exact variants/SKUs, server totals, secure confirmation links, duplicate guard, profiles, previous addresses and an advisory reliability indicator.

## Delivery & mobile driver

Internal drivers, freelancers and companies; zones/fees, assignment coverage, manifests, attempts/retries, failure reasons and offline-safe mobile actions.

## Payments & cash custody

Delivery and payment remain separate. Driver delivery can post collection automatically; cash stays assigned to its holder until an approved reconciliation closes it.

## Inventory & returns

Reservations and movement ledger, available stock, low-stock warnings, suppliers/cost history, restock budget, returns, exchanges, refunds and condition-based disposition.

## Decision intelligence

Revenue/profit/cash separation, product and channel economics, Lebanon growth map, delivery Pareto, repeat customers, action-ranked warnings and transparent methodology.

## Company administration

Business registration, role-specific workspaces, employee access, editable products/customers/suppliers, delivery partners, all governorates, audit history and notifications.

## Technical architecture

Amazon Cognito provides identity; S3 stores authorized files; CloudWatch, WAF, Secrets Manager and AWS Budgets provide protection and cost control. SQL views expose orders, lines, variants, addresses, payments, delivery performance and cash custody directly in SSMS.

## Development process and quality evidence

Nine controlled phases: product contract → AWS/design foundation → commerce data → orders → delivery/money → stock/returns → Decision Engine → hardening → focused expansion. Current local evidence: TypeScript checks, lint, 52 automated tests, production build, responsive role/browser review, append-only audit events and SQL schema/view tests.

# Challenges solved and final handoff

## 1 · Money truth

Challenge: delivered did not prove paid, and paid did not prove cash returned.

Solution: separate payment entries, automatic collection posting, holder-specific custody movements and owner/manager reconciliation with discrepancy explanations.

## 2 · Mixed local reality

Challenge: USD/LBP prices, local payment methods, unreliable addresses and mixed couriers corrupt generic analytics.

Solution: original-currency records, owner-approved FX snapshots, Lebanese address/zone setup, configurable resources and explicit missing-data warnings.

## 3 · Intelligence trust

Challenge: attractive charts can combine incompatible money or claim profit without cost data.

Solution: metric contracts, USD-equivalent conversion, completeness labels, drill-through, deterministic warning thresholds and advisory predictions that never execute consequential actions.

## Team contributions

Shawn Lamouza · shawnlamouza100@gmail.com: product direction, Lebanese business research, survey design, validation and competition coordination.

[Add any additional member names]: assign their exact contribution before submission.

## Submission links and final readiness

### GitHub repository

Target: [github.com/shawnlamouza/masaar](https://github.com/shawnlamouza/masaar) · local commit and publishing guide are ready.

### Demo application

Local: <http://localhost:5173> · public AWS URL requires deployment credentials.

### Demo video

[ADD ≤2-MINUTE VIDEO URL] · Use docs/DEMO\_SCRIPT.md as the recording script.

### Final documents

Functional specification, implementation/release plan, SQL scripts and this submission PDF are in /output and /docs.

## Competition promise

Masaar does not attempt to become another generic ERP or social network. It owns one difficult loop exceptionally well: capture the operation, protect the money and stock, explain the business impact, and tell a Lebanese owner what to do next—with evidence.
